

Supplementary material

Heatmaps represent desensitization in the lidocaine (LID) group at each timepoint. The intensity of blue indicates the number of horses ($n = 8$) showing desensitization at each specific evaluation point, defined by **metameric region** (X-axis) and **dorsoventral point** (Y-axis). Each cell corresponds to one combination of **metamer** and **dorsoventral point**, and the value reflects the number of horses in which desensitization was observed at that location.
